

# Computer Networking

## Introduction - 2

*Prof. Andrzej Duda*  
*duda@imag.fr*

**`http://duda.imag.fr`**

# Contents

- Introduction 2
  - layered architecture
  - encapsulation
  - interconnection structures
  - performance

# Internet protocol stack

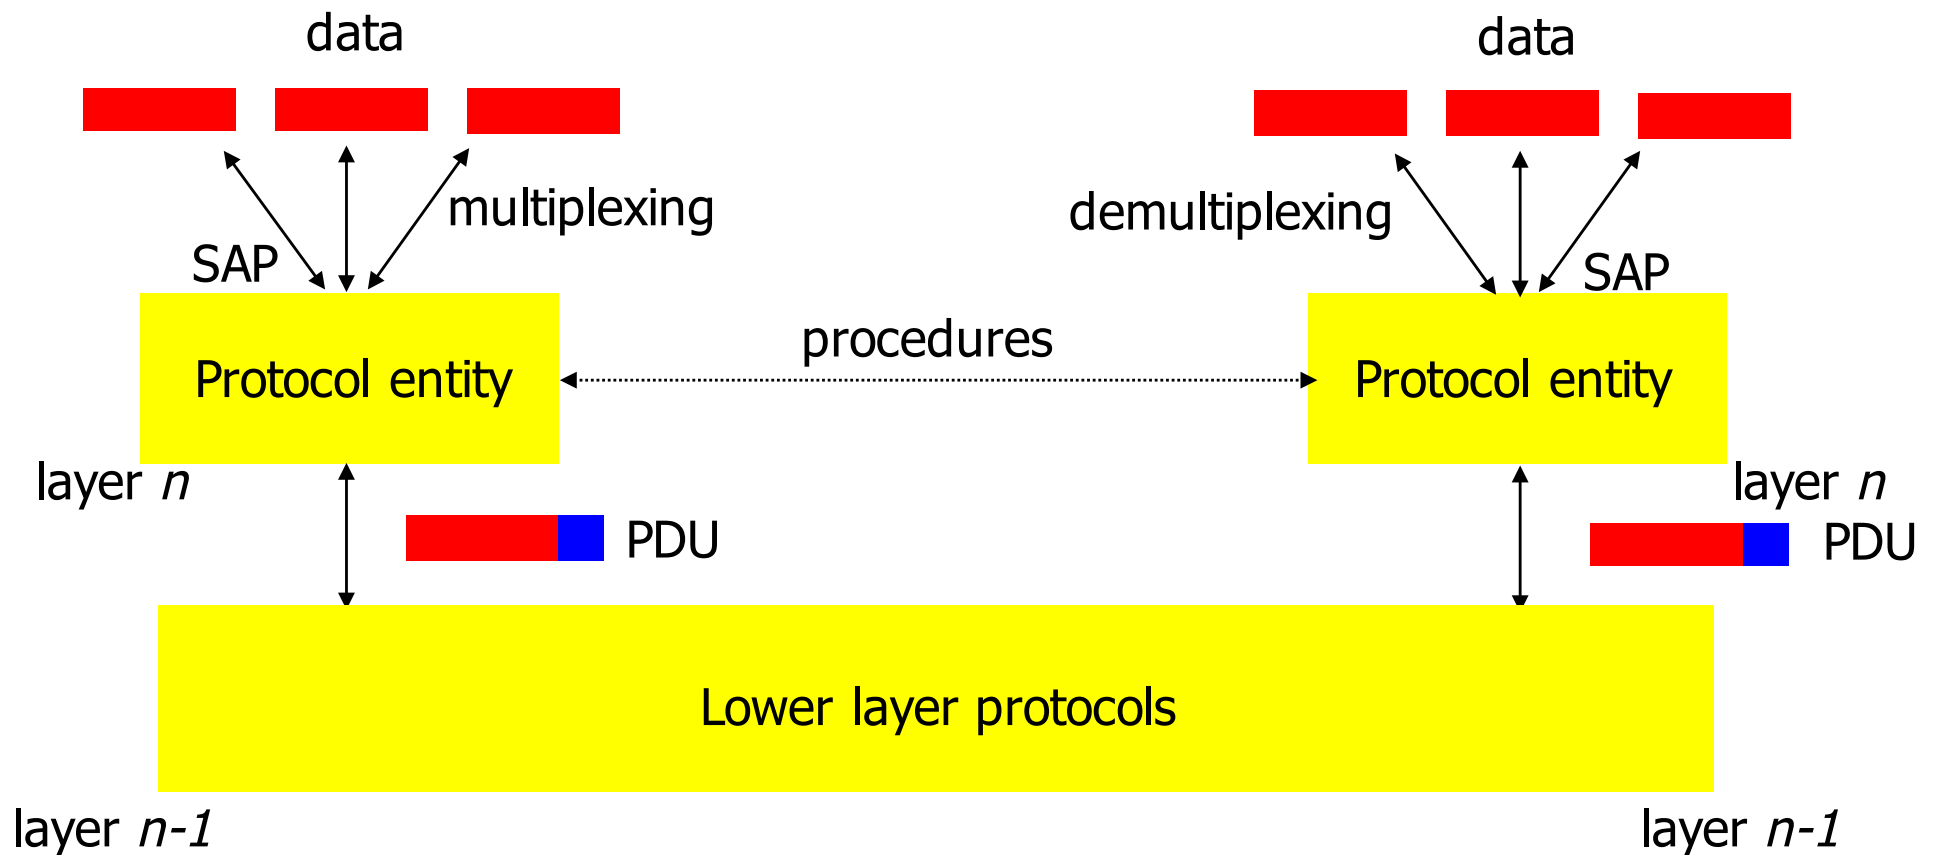

- **Application:** supporting network applications
  - FTP, SMTP, HTTP, OSPF, RIP
- **Transport:** host-host data transfer
  - TCP, UDP
- **Network:** routing of datagrams from source to destination
  - IP
- **Link:** data transfer between neighboring network elements
  - PPP, Ethernet
- **Physical:** bits “on the wire”

# Layered protocol stack

- Protocol entity
  - provides a set of services, eg.
    - *connect, send*
  - data multiplexing/demultiplexing
  - construction/analysis of PDUs
  - execution of procedures
- Protocol unit (PDU)
  - header: control functions
  - opaque data
- Procedures
  - actions to perform protocol functions: e.g. lost packet retransmission

# Protocol architecture

# Application Layer

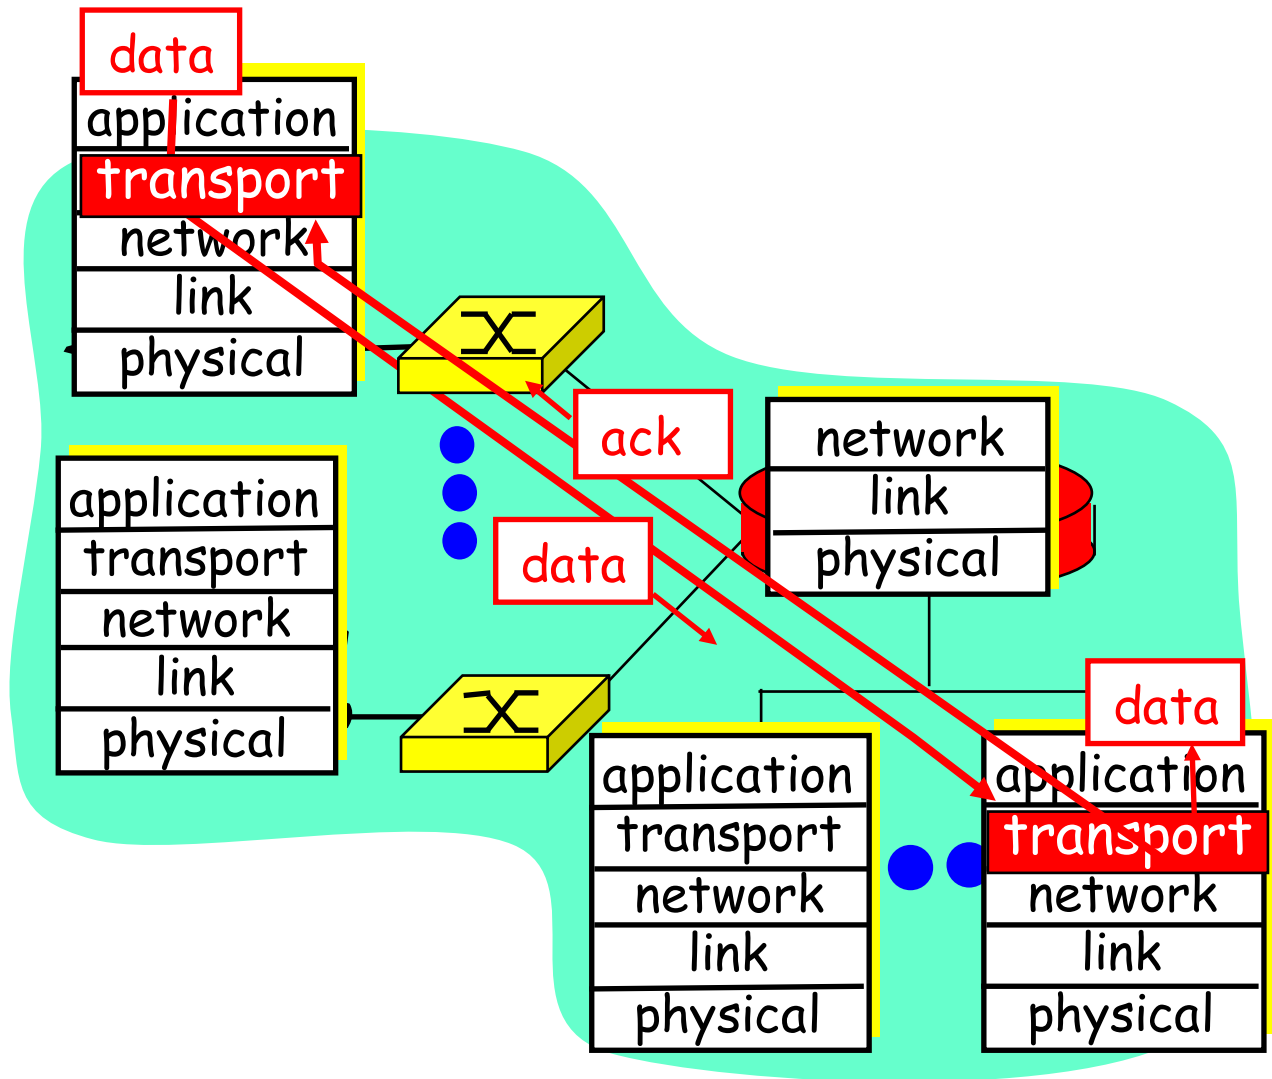

- Application layer supports network application
  - applications that are distributed over the network
  - applications that communicates through the network
- Many known protocols
  - FTP: file transfer
  - SMTP: email protocol
  - HTTP:web protocol
- An application uses UDP or TCP, it is a designer's choice
- Interface with the transport layer
  - use for example the **socket** API: a library of C functions
  - **socket** also means (IP address, port number)

# Transport Layer

- Why a transport layer ?
  - **transport layer** = makes network service available to programs
  - is end-to-end only, not in routers
- In TCP/IP there are two transport protocols
  - UDP (user datagram protocol)
    - unreliable
    - offers a datagram service to the application (unit of information is a message)
  - TCP (transmission control protocol)
    - reliable
    - offers a stream service (unit of information is a byte)

# Layering: *logical* communication

- E.g.: transport
- take data from app
- add addressing, reliability check info to form “datagram”
- send datagram to peer
- wait for peer to ack receipt
- analogy: post office

# TCP

HTTP Request : 1146 octets

HTTP Reply : 1852 octets

Taille maximale de segment : 536 octets

Temps aller-retour (RTT) : ~70 ms  
(North Carolina -> Illinois)

Problèmes :

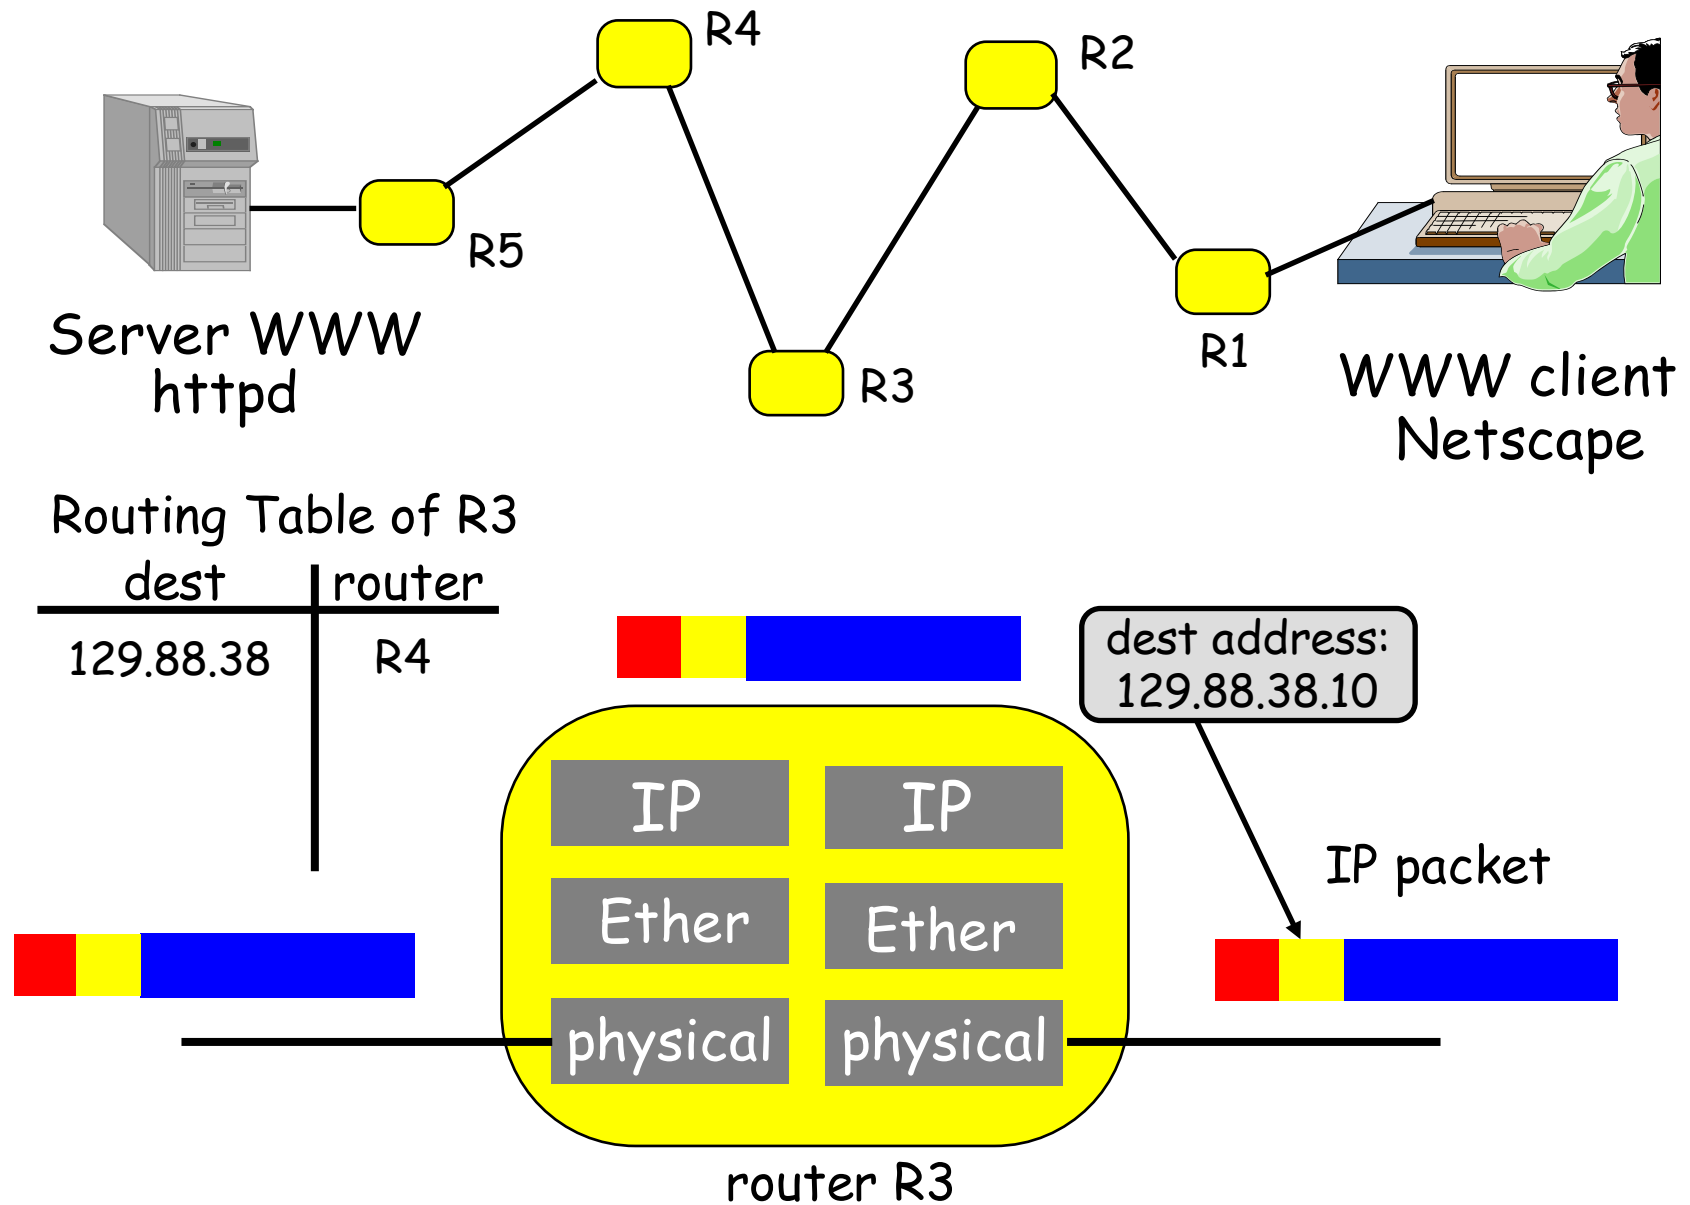

- établissement de connexion
- démarrage lent (Slow Start)
- ACK retardé
- temps aller-retour

# Network Layer

- Set of functions required to transfer packets end-to-end (from host to host)
  - **hosts are not directly connected - need for intermediate systems – routers**
  - IP protocol
- Intermediate systems
  - **routers**: forward packets to the final destination
  - interconnection devices

# IP

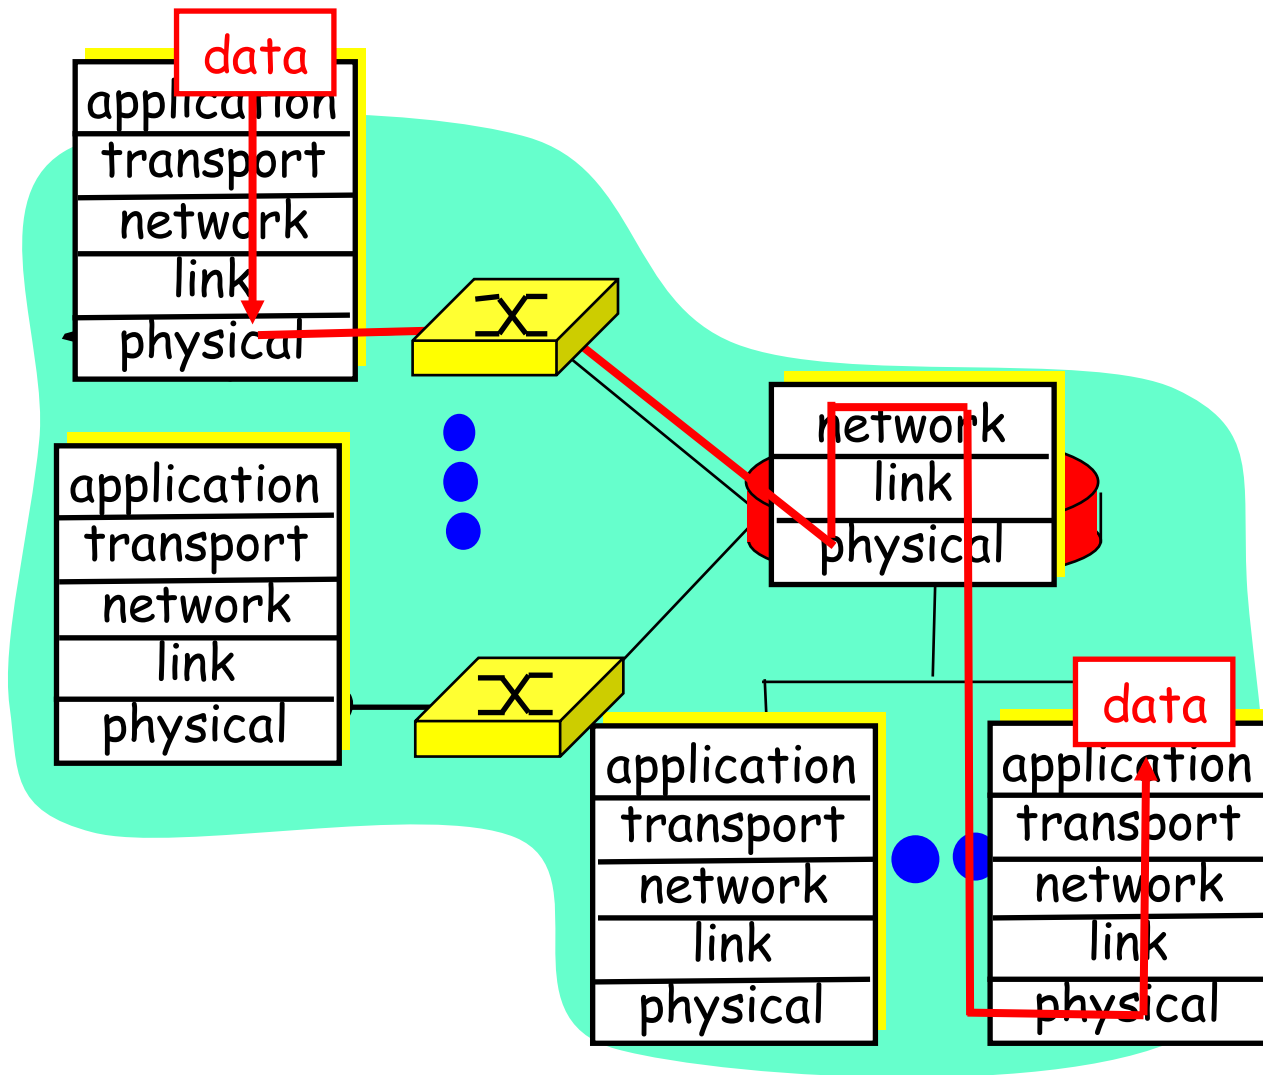

# Physical Layer

## Data Link Layer - LANs

- Physical transmission = **Physical** function
  - bits  $\leftrightarrow$  electrical / optical signals
  - transmit individual bits over the cable: modulation, encoding
- Frame transmission = **Data Link** function
  - bits  $\leftrightarrow$  frames
  - bit error detection
  - packet boundaries
  - in some cases: error correction by retransmission (802.11)
- ADSL (xDSL), LANs - Ethernet

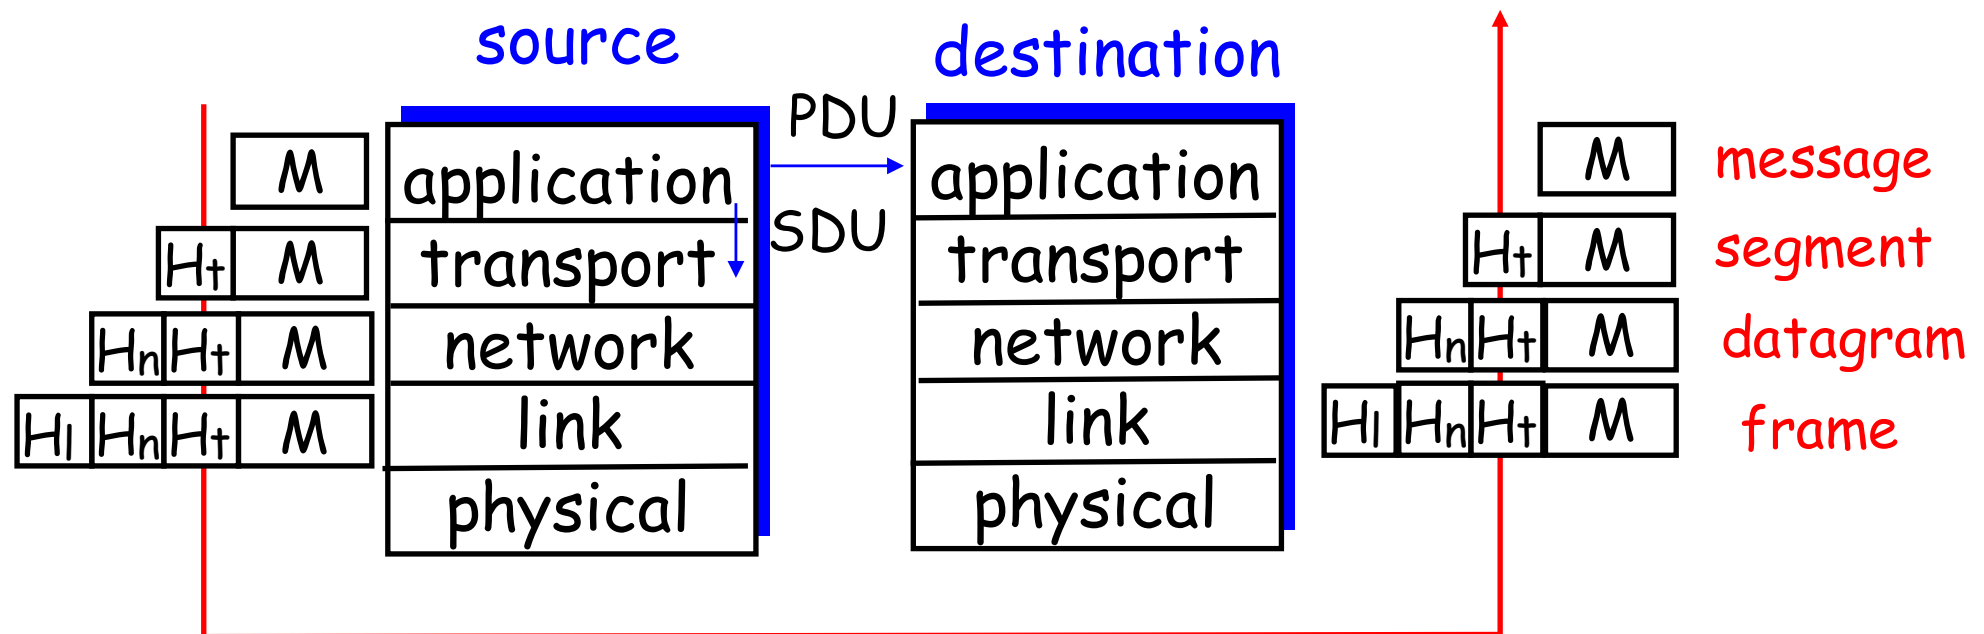

# Layering: flow of data

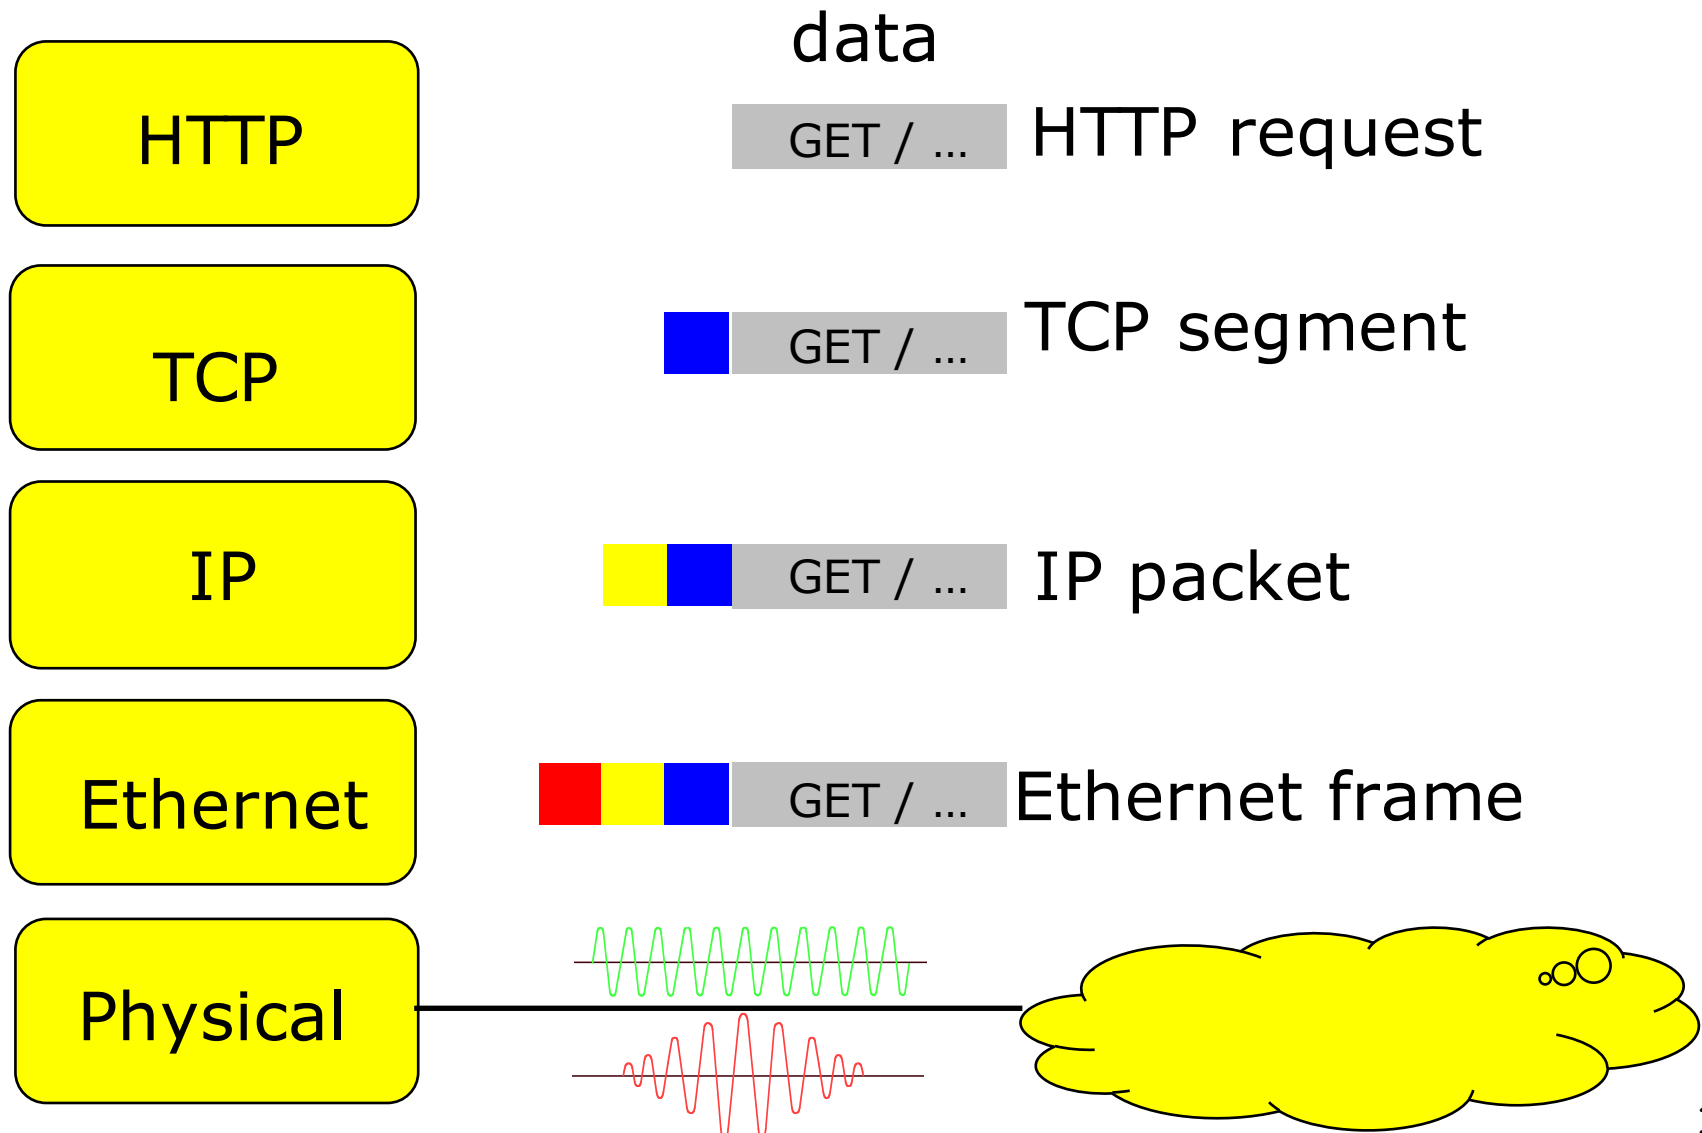

# Protocol layering and data

Each layer takes data from above

- adds header information to create new data unit
- passes new data unit to layer below

# TCP/IP Architecture

# Encapsulation

# Ethereal

## Ethernet II

Destination: 00:03:93:a3:83:3a (Apple\_a3:83:3a)

Source: 00:10:83:35:34:04 (HEWLETT-\_35:34:04)

Type: IP (0x0800)

Internet Protocol, Src Addr: 129.88.38.94 (129.88.38.94), Dst Addr:  
129.88.38.241 (129.88.38.241)

Version: 4

Header length: 20 bytes

Differentiated Services Field: 0x00 (DSCP 0x00: Default; ECN:  
0x00)

Total Length: 1500

Identification: 0x624d

Flags: 0x04

Fragment offset: 0

Time to live: 64

Protocol: TCP (0x06)

Header checksum: 0x82cf (correct)

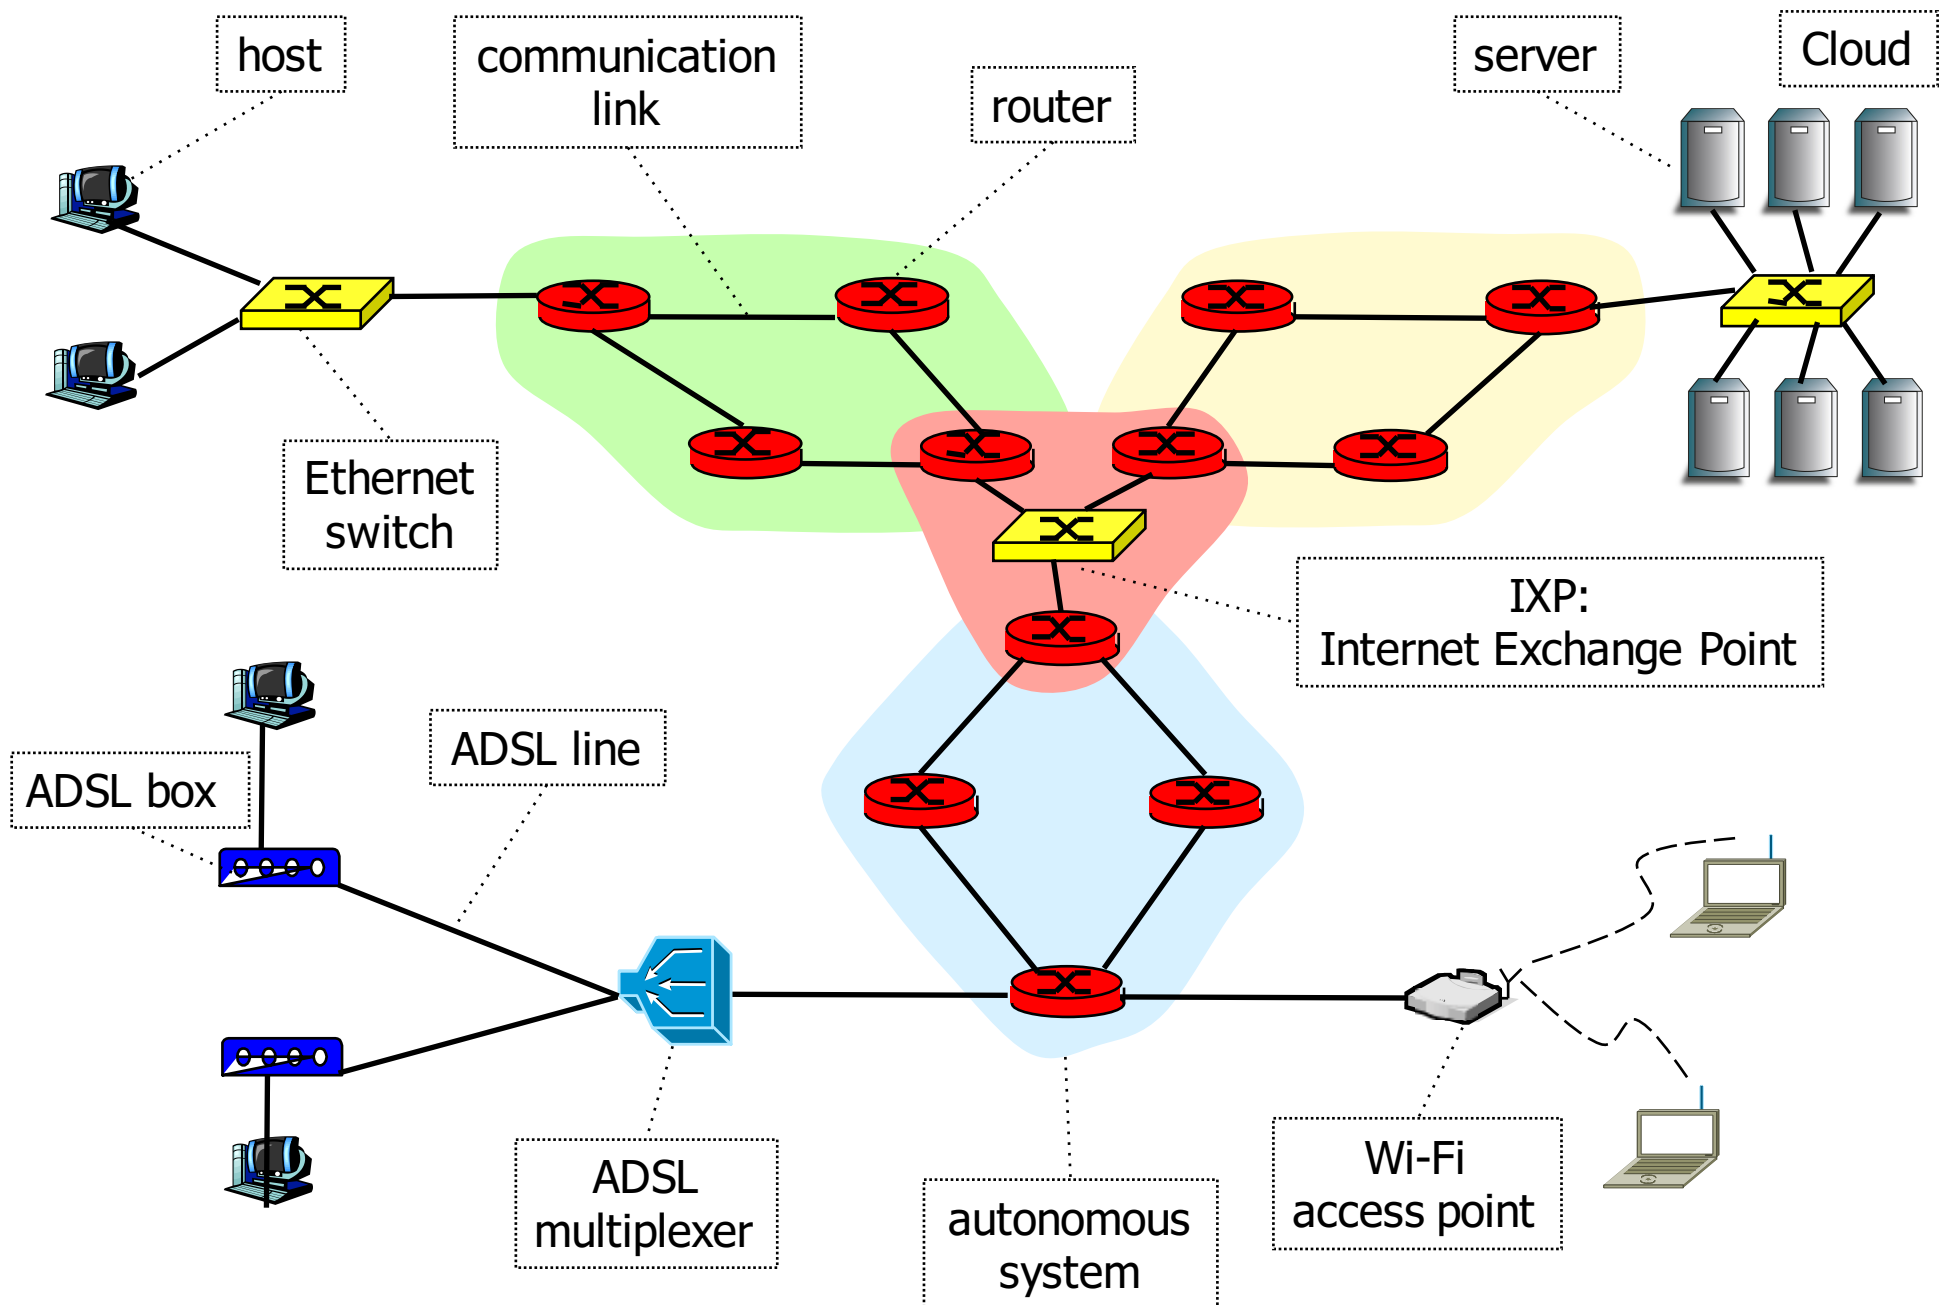

Source: 129.88.38.94 (129.88.38.94)

Destination: 129.88.38.241 (129.88.38.241)

# Ethereal

Transmission Control Protocol, Src Port: 34303 (34303), Dst Port:  
6000 (6000), Seq: 4292988915, Ack: 3654747642, Len: 1448  
Source port: 34303 (34303)  
Destination port: 6000 (6000)  
Sequence number: 4292988915  
Next sequence number: 4292990363  
Acknowledgement number: 3654747642  
Header length: 32 bytes  
Flags: 0x0010 (ACK)  
Window size: 41992  
Checksum: 0x9abe (correct)  
Options: (12 bytes)

# Internet – global view

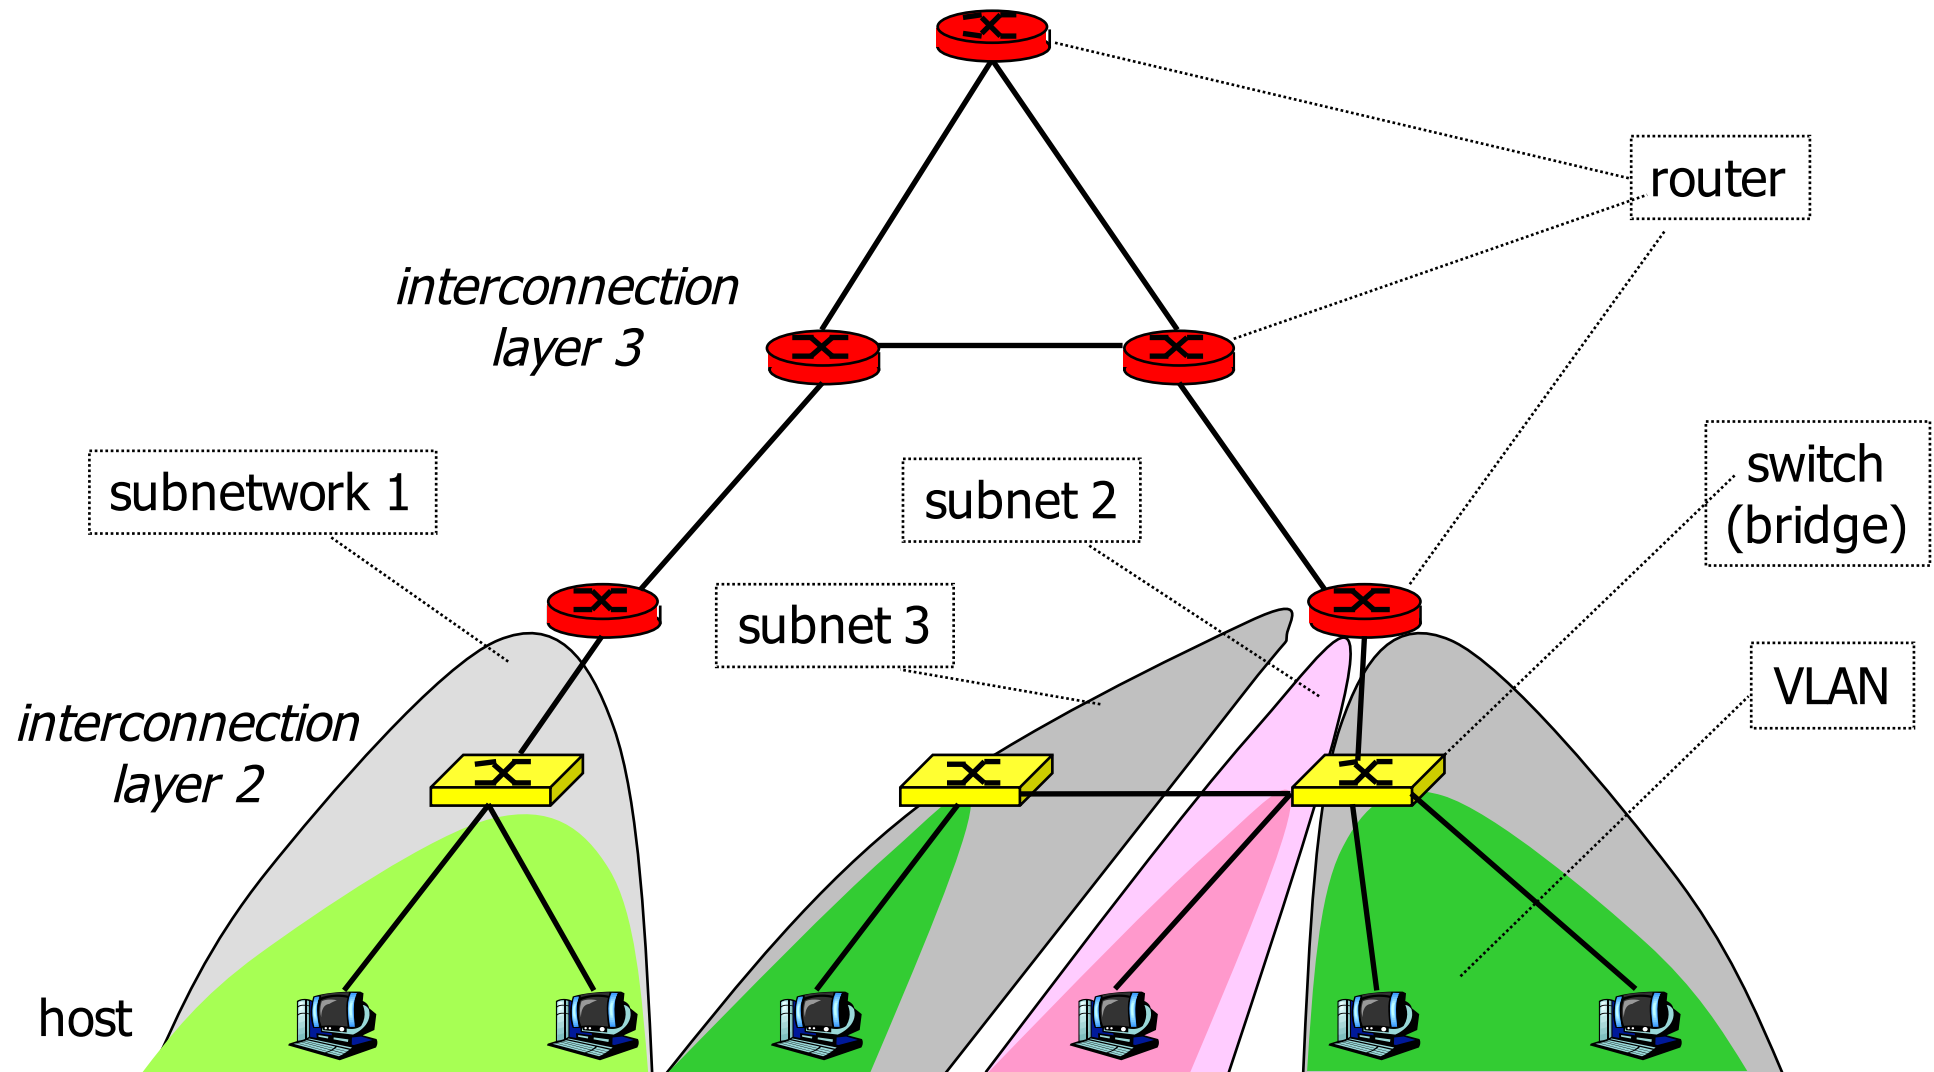

# Interconnection structure - layer 2

# Interconnection at layer 2

- Switches (bridges)
  - interconnect hosts
  - logically separate groups of hosts (VLANs)
  - managed by one entity
- Type of the network
  - broadcast
- Forwarding based on MAC address
  - flat address space
  - forwarding tables: one entry per host
  - works if no loops
    - careful management
    - Spanning Tree protocol
  - not scalable

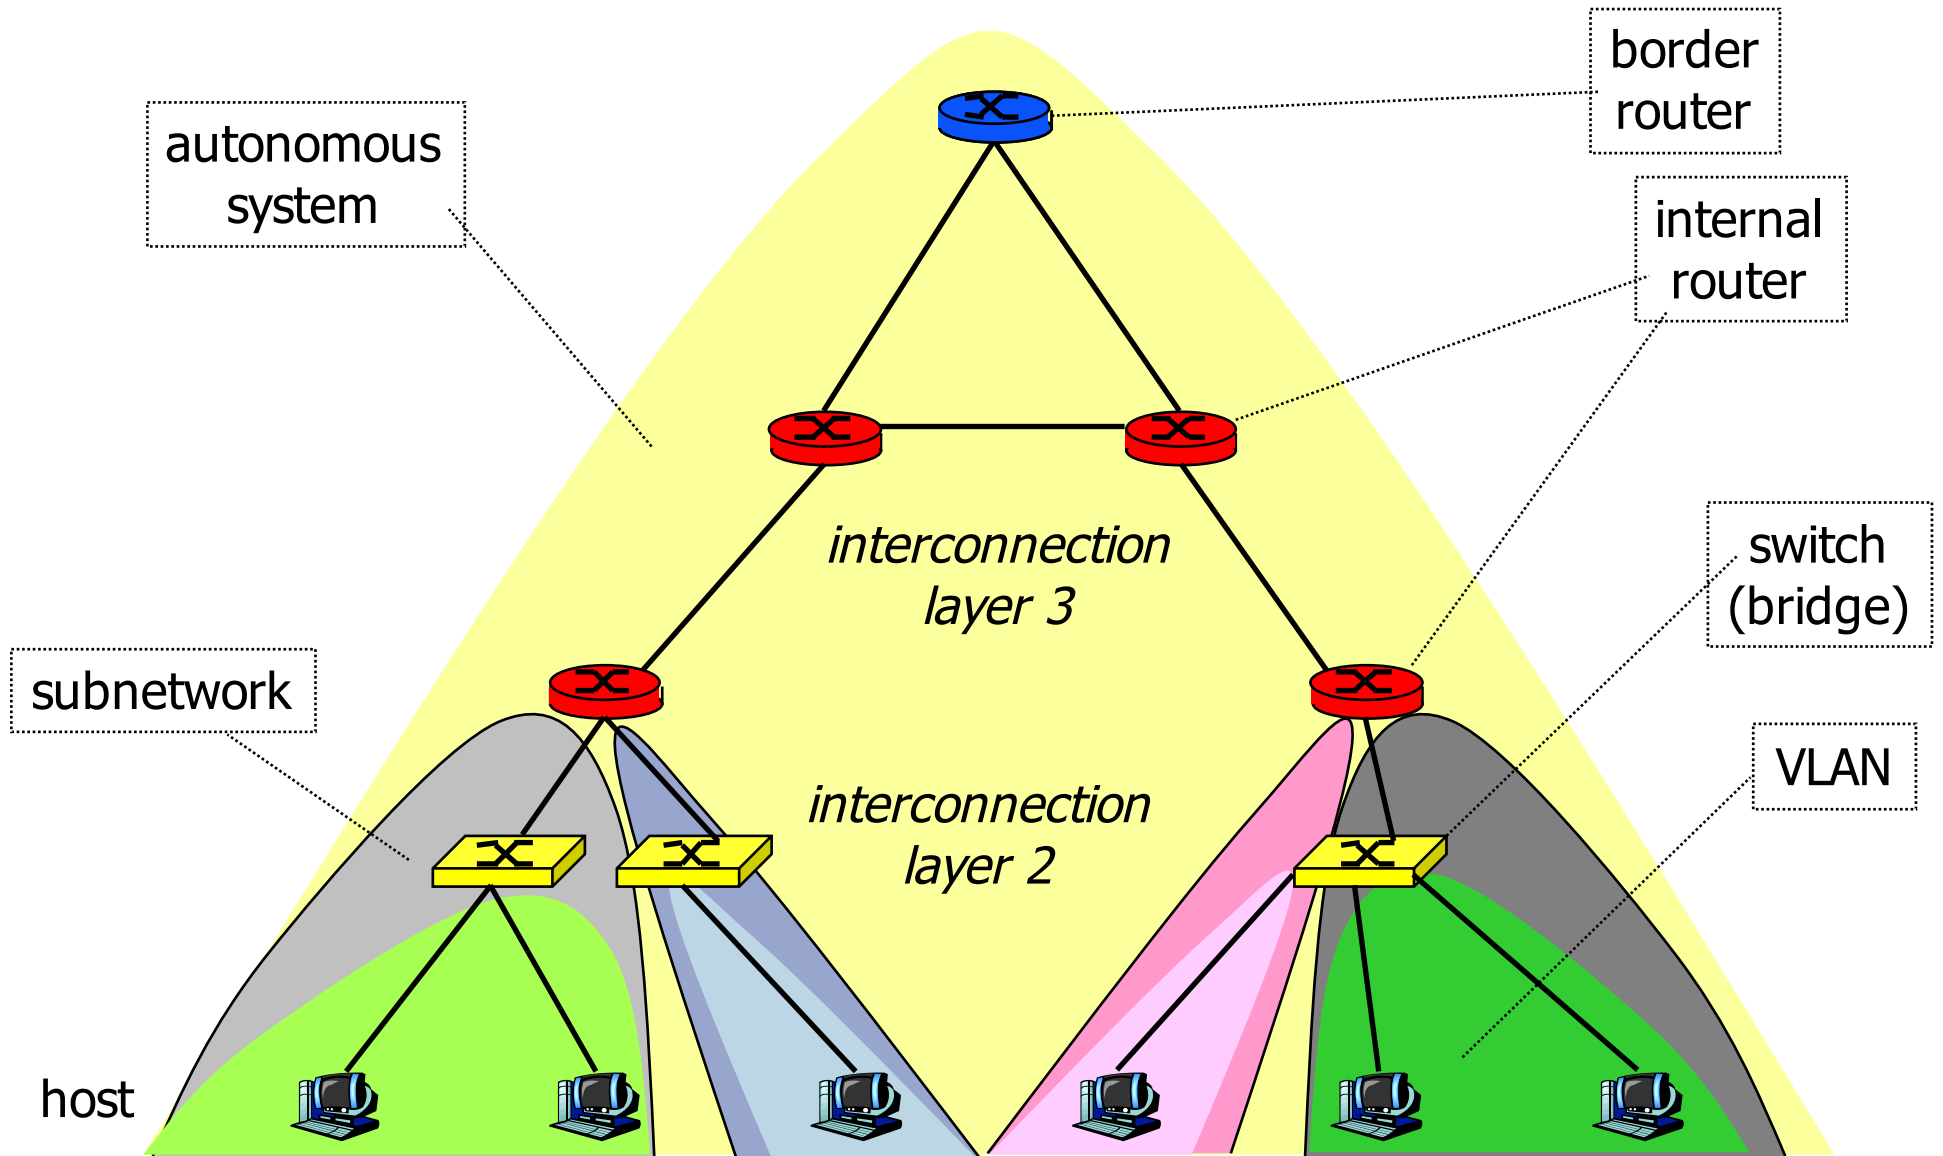

# Interconnection structure - layer 3

# Interconnection at layer 3

- Routers
  - interconnect subnetworks
  - logically separate groups of hosts
  - managed by one entity
- Forwarding based on IP address
  - structured address space
  - routing tables: aggregation of entries
  - works if no loops - routing protocols (IGP - Internal Routing Protocols)
  - scalable inside one administrative domain

# Autonomous systems

# Internet

# Interconnection of AS

- Border routers
  - interconnect AS
- NAP or GIX, or IXP
  - exchange of traffic - peering
- Route construction
  - based on the path through a series of AS
  - based on administrative policies
  - routing tables: aggregation of entries
  - works if no loops and at least one route - routing protocols (EGP - External Routing Protocols)

# Performance

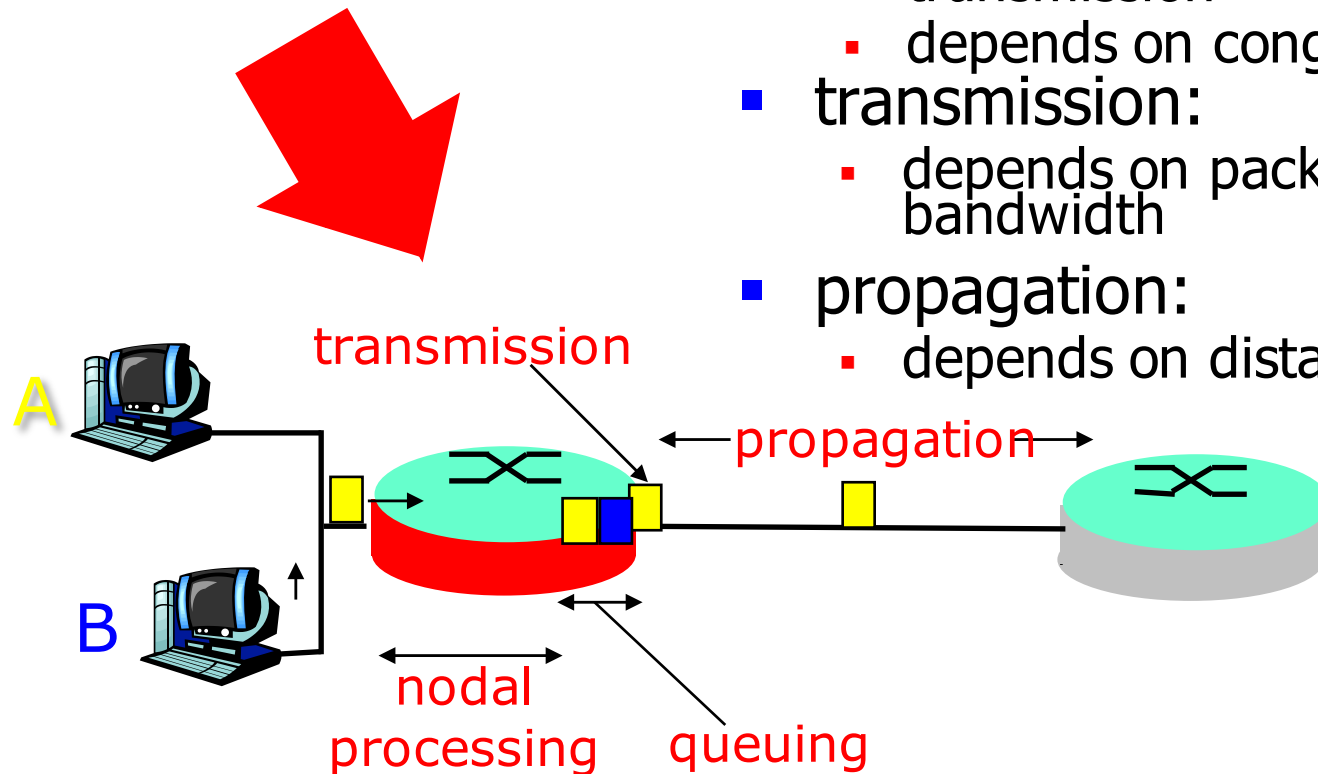

- Bit Rate (débit binaire) of a transmission system
  - bandwidth, throughput
  - number of bits transmitted per time unit
  - units: b/s or bps, kb/s = 1000 b/s, Mb/s = 10e+06 b/s, Gb/s=10e+09 b/s
  - OC3/STM1 - 155 Mb/s, OC12/STM4 - 622 Mb/s, and OC48/STM-16 - 2.5 Gb/s, OC192/STM-48 10 Gb/s
- Latency or Delay
  - time interval between the beginning of a transmission and the end of the reception
  - RTT - Round-Trip Time

# Delay in packet-switched networks

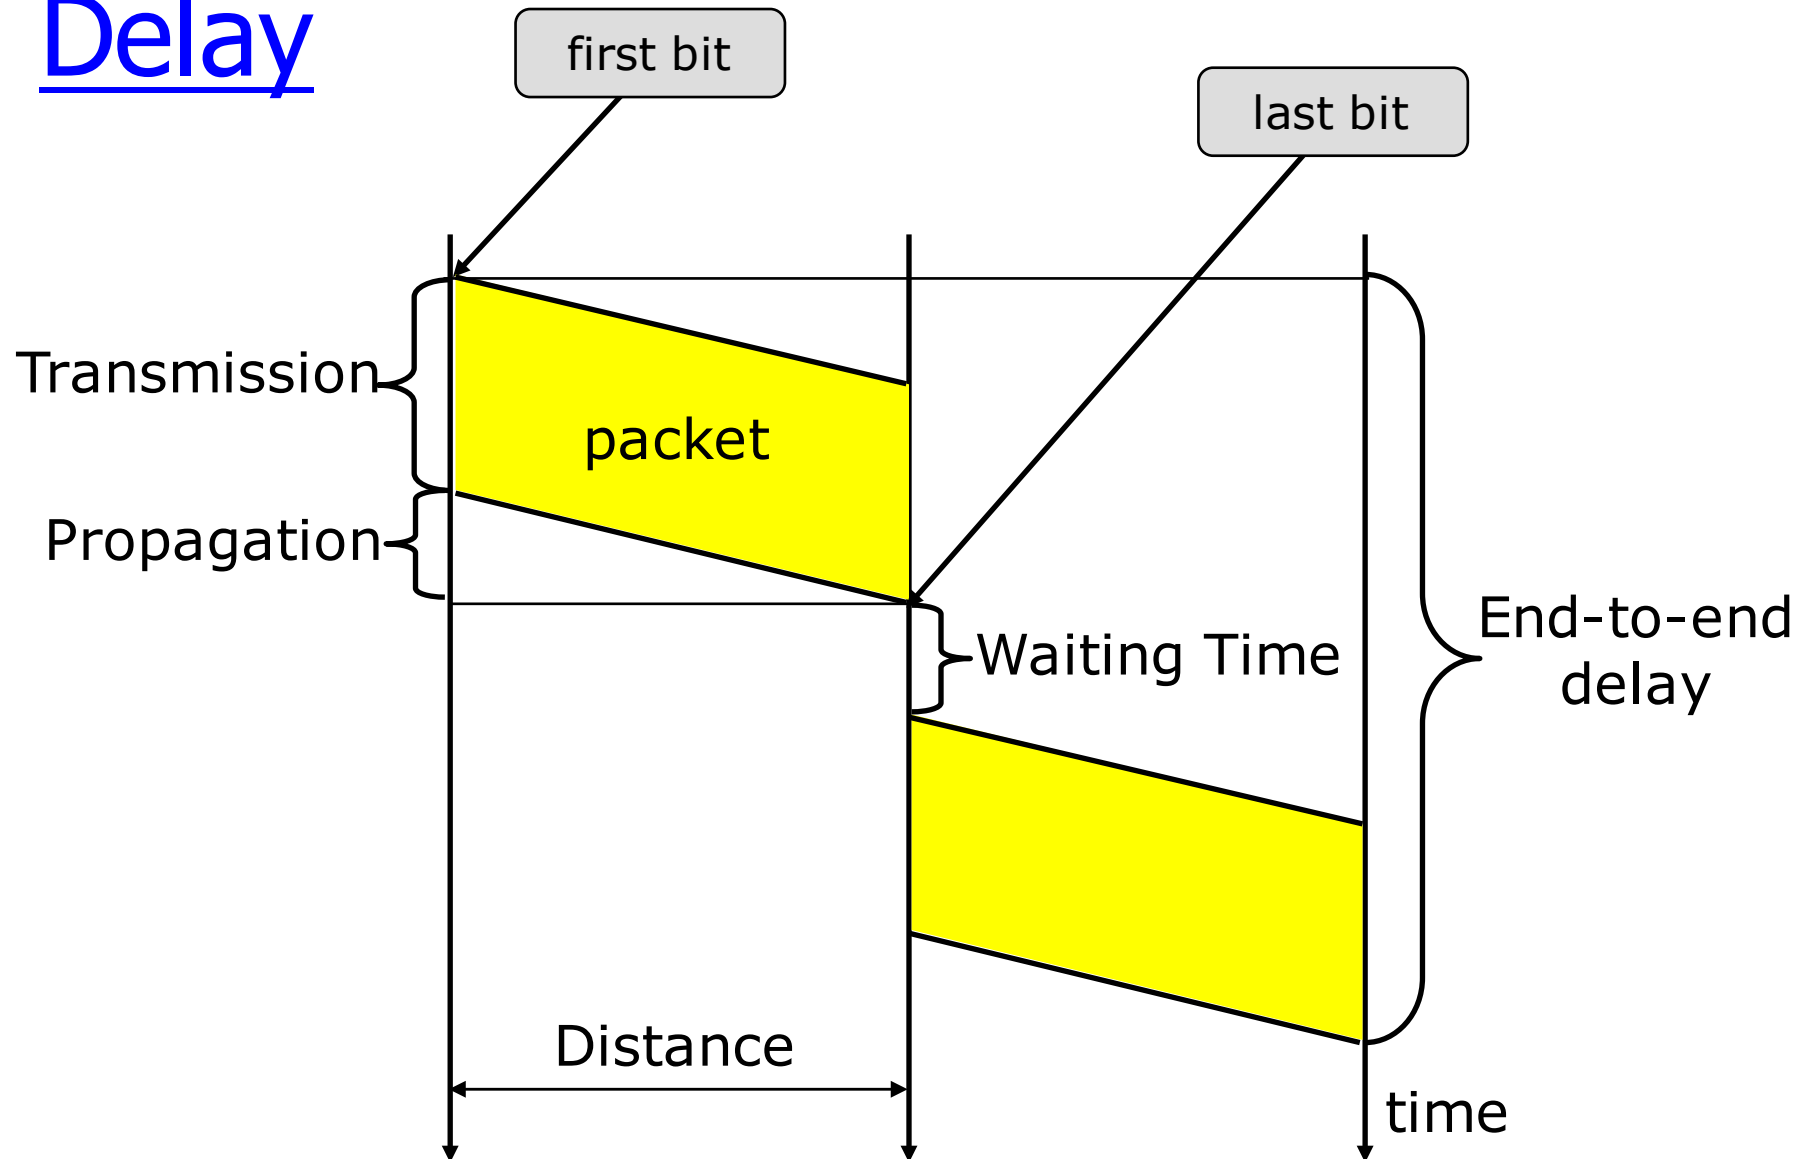

packets experience **delay**  
on end-to-end path

- **four** sources of delay at each hop

- nodal processing:
  - check bit errors
  - determine output link
- queuing
  - time waiting at output link for transmission
  - depends on congestion level of node
- transmission:
  - depends on packet length and link bandwidth
- propagation:
  - depends on distance between nodes

# Delay

# Performance

- Latency

- Latency = Propagation + Transmission + Wait
- Propagation = Distance / Speed
  - copper : Speed =  $2.3 \times 10^8$  m/s
  - glass : Speed =  $2 \times 10^8$  m/s
  - Transmission = Size / BitRate

- 5  $\mu$ s/km

- New York - Los Angeles in 24 ms

- request - 1 byte, response - 1 byte: 48 ms
- 25 MB file on 10 Mb/s: 20 s

- World tour in 0.2 s

# Example

- At time 0, computer A sends a packet of size 1000 bytes to B; at what time is the packet received by B (speed =  $2 \times 10^8$  m/s)?

<i>distance</i>	20 km	20000 km	2 km	20 m
<i>bit rate</i>	10kb/s	1 Mb/s	10 Mb/s	1 Gb/s
<i>propagation</i>	0.1ms	100 ms	0.01 ms	0.1 $\mu$ s
<i>transmission</i>	800 ms	8 ms	0.8 ms	8 $\mu$ s
<i>latency</i>	800.1 ms	108 ms	0.81 ms	8.1 $\mu$ s
	<i>modem</i>	<i>satellite</i>	<i>LAN</i>	<i>Ether 1G</i>

# Bandwidth-Delay Product

- Bandwidth-Delay product
  - how many bits should we send before the arrival of the first bit?
  - good utilization - keep the pipe filled!

# A Simple Protocol: Stop and Go

- Packets may be lost during transmission:  
bit errors due to channel imperfections, various noises.
- Computer A sends packets to B; B returns an acknowledgement packet immediately to confirm that B has received the packet;  
A waits for acknowledgement before sending a new packet; if no acknowledgement comes after a delay  $T_1$ , then A retransmits

# A Simple Protocol: Stop and Go

- **Question:** What is the maximum throughput assuming that there are no losses?

*notation:*

- packet length =  $L$ , constant (in bits);
- acknowledgement length =  $I$ , constant
- channel bit rate =  $b$ ;
- propagation =  $D$
- processing time = 0

# Solution (1)

$$\text{cycle time} = T + 2D + T'$$

$$\text{useful bits per cycle time} = L$$

$$\text{throughput} = Lb / (L + l + 2Db) = b / (\omega + \beta/L)$$

with  $\omega = (L+l)/L = \text{overhead}$  and  $\beta = 2Db = \text{bandwidth-delay product}$

# Solution

distance	20 km	20000 km	2 km	20 m
bit rate	10kb/s	1 Mb/s	10 Mb/s	1 Gb/s
propagation	0.1ms	100 ms	0.01 ms	0.1 $\mu$ s
transmission	800 ms	8 ms	0.8 ms	8 $\mu$ s
delay	800.1 ms	108 ms	0.81 ms	8.1 $\mu$ s
	<i>modem</i>	<i>satellite</i>	<i>LAN</i>	<i>Ether 1G</i>
$\beta = 2 Db$	2 bits	200 000 bits	200 bits	200 bits
throughput = $b \times 99.98\%$		3.8%	97.56%	97.56%

# Bandwidth-delay

$$\text{window in time} = T + 2D + T$$

$$\text{window in bits} = (T + 2D + T)b = 2L + \beta$$

## Solution (2)

distance	20 km	20000 km	2 km	20 m
bit rate	10kb/s	1 Mb/s	10 Mb/s 1 Gb/s	
propagation	0.1ms	100 ms	0.01 ms 0.1μs	
transmission	800 ms 8 ms	0.8 ms	8 μs	
reception time	800.1 ms	108 ms	0.81 ms 8.1 μs	
	<i>modem</i>	<i>satellite</i>	<i>LAN</i>	<i>Hippi</i>
$\beta=2 Db$	2 bits	200 000 bits	200 bits	200 bits
throughput = $b \times$	99.98% 3.8%	97.56%	97.56%	

# Waiting time

- Queueing system M/M/1
  - interarrival times  $\sim$  exponentially distributed
  - service times  $\sim$  exponentially distributed
  - arrival rate  $\lambda$ , service rate  $\mu$ , utilization  $\rho = \lambda/\mu$
  - number of packets  $N$ , waiting time  $T$

$$N = \frac{\rho}{(1-\rho)}$$

$$T = \frac{1}{\mu(1-\rho)}$$

$$T = \frac{N}{\lambda}$$

# Waiting time

- Average packet length 1500 bytes
  - link with 1 Mb/s bit rate (propagation = 0)
    - transmission time 12 ms
    - service rate 83 packet/s

$\lambda$	[p/s]	10	40	60	70
$1/\lambda$	[ms]	100	25	16	14
$T$	[ms]	13	23	43	76

# Waiting time

# Summary

- Layered stack
  - Isolation and virtualization of functions
  - Data encapsulation
- Internet – hierarchical interconnection structures
  - L2 – VLANs
  - L3 – subnetworks
  - Global – AS
- Performance
  - Transmission time
  - Propagation time
  - Bandwidth-delay product
  - Queueing delay
